Base station lithium battery parameters

Overview

Learn about the key technical parameters of lithium batteries, including capacity, voltage, discharge rate, and safety, to optimize performance and enhance the reliability of energy storage systems. What are the technical parameters of a lithium battery?

Learn about the key technical parameters of lithium batteries, including capacity, voltage, discharge rate, and safety, to optimize performance and enhance the reliability of energy storage systems. 1. Battery Capacity (Ah) 2. Nominal Voltage (V) 3. Charge/Discharge Rate (C) 4. Depth of Discharge (DOD) 5. State of Charge (SOC) 6.

What is lithium battery parameter identification based on dual polarization model?

Lithium battery parameter identification and SOC estimation based on dual-polarized model Abstract. An equivalent circuit model of dual polarization (DP) of lithium battery was established according to the application characteristics of lithium battery under the standby condition of 5G base station.

Can SOC of lithium battery be accurately estimated?

Through the analysis of the simulation and test results, it is believed that the SOC of lithium battery can be accurately estimated by using the DP equivalent circuit model parameters and UKF SOC estimation, and the estimation accuracy can meet the real-time use requirements of 5G base station standby power.

Why are lithium batteries important for energy storage systems?

Safety Lithium batteries play a crucial role in energy storage systems, providing stable and reliable energy for the entire system. Understanding the key technical parameters of lithium batteries not only helps us grasp their performance characteristics but also enhances the overall efficiency of energy storage systems.

Why do lithium-ion batteries have a high-precision SoC estimation?

This is because the external electronic behaviors, aging, and temperature of the lithium-ion batteries can be well approximated by the battery model [29 – 31], and the high-precision SOC estimation can be obtained.

How are battery model parameters identified online?

The battery model parameters are identified online using the bias compensation least squares (BCLS), while the SOC is estimated applying the alternate (ALT) algorithm, which can switch the computational logic between H-infinity filter (HIF) and ampere-hour integral (AHI) to improve the computational efficiency and accuracy.
