Overview

What are the different types of power system grounding?

Part 3 describes protection methods for the various types of grounding and Part 4 provides a conclusion and bibliography of additional resource material. There are several methods of power system grounding. These include low-resistance grounded (LRG), effectively grounded, reactance grounded, high-resistance grounded (HRG), and ungrounded.

What is high-resistance grounding?

Another aspect of high-resistance grounding is that corona starts playing a significant part towards damage for systems with line-to-line voltages greater than about 7.2 kV, if continuous duty is desired (i.e., continue operating indefinitely under ground fault conditions). High-resistance grounding of a generator neutral is illustrated in Fig. 11.

What is a low-resistance grounded generator?

This grounding method provides the best of both worlds; the system is low-resistance grounded allowing quick tripping and isolation of any ground faults while the generator is high-resistance grounded, essentially eliminating ground fault damage and transient overvoltage damage.

What type of grounding should a generator have?

GENERATOR AND SYSTEM SOLUTIONS The design engineer faced with the dilemma of protecting the generator for internal ground faults and providing grounding for the system has traditionally chosen one system and lived with the risks. The traditional choice for medium-voltage systems has been low-resistance grounding.

Which type of grounding is best for a medium-voltage generator?

The traditional choice for medium-voltage systems has been low-resistance grounding. This is an excellent choice for medium-voltage power systems,

except for the generator itself under internal ground faults. The various solutions for grounding and protecting generators are discussed below.

How is a neutral connected to a ground system?

III. EFFECTIVELY GROUNDED SYSTEM For effectively grounded systems, the neutral is connected to ground through a sufficiently low impedance, intentionally inserted such that the ratio X0/X1 is positive and less than 3, and the ratio R0/X1 is positive and less than 1.
