Cadmium oxide thin film photovoltaic glass

Overview

Why is CdTe thin film solar cell suitable for building integrated photovoltaics?

Cadmium Telluride thin film solar cell is very suitable for building integrated photovoltaics due to its high efficiency and excellent stability. To further reduce the production costs, relieve the scarcity of Tellurium, and apply in building integrated photovoltaics, ultra-thin CdTe photovoltaic technology has been developed.

What is thin film photovoltaic (PV)?

Introduction Thin film photovoltaic (PV) technologies often utilize monolithic integration to combine cells into modules. This is an approach whereby thin, electronically-active layers are deposited onto inexpensive substrates (e.g. glass) and then interconnected cells are formed by subsequent back contact processes and scribing.

What are the advantages of cadmium telluride (CdTe) thin film solar cells?

1. Introduction Cadmium Telluride (CdTe) thin film solar cells have many advantages, including a low-temperature coefficient (-0.25 %/°C), excellent performance under weak light conditions, high absorption coefficient (10.5 cm^{-1}), and stability in high-temperature environments.

What materials are used in CdTe thin film solar cells?

The main materials used in CdTe thin film solar cell modules include transparent conductive oxide glass (TCO), high-purity CdTe, conductive pastes, and back electrodes. Among them, except for transparent conductive oxide glass, CdTe raw materials account for the highest cost.

When did CdTe thin film solar cells come out?

CdTe thin film solar cells first emerged in the 1970s, Bonnet and Rabenhorst introduced CdS/CdTe heterojunction in CdTe devices, and achieved an efficiency of 6 %. Since then, researchers began to use this type of

heterojunction to prepare CdTe thin film solar cells.

Why is CDs thin film used in solar cells?

It is widely used as a buffer layer in solar cells because of its superior optoelectronic properties. The optical transparency of the film can be easily controlled by thickness variation. The optimized thickness of CdS thin film for solar cell applications is 120 nm. This cell achieved higher efficiency of 21%.
