# Can wind and solar energy storage power stations make money

### **Overview**

Can wind and solar power be sustainable?

Thanks to dramatic improvements in the manufacture of both wind and solar technologies, that appears to be more than possible. A new study published in the journal Energy & Environmental Science finds that wind and solar not only produce enough power to be energetically sustainable but could support grid-scale energy storage as well.

Does storage increase the value of a solar or wind plant?

Storage can increase the revenue generated by a solar or wind plant, but it also increases the capital costs of the plant. Here we optimize both the discharging behaviour, as done above, and the storage system size, to maximize the value of the electricity generation.

Is solar storage more valuable than wind?

Storage is more valuable for wind than solar in two out of the three locations studied (Texas and Massachusetts), but across all locations the benefit from storage is roughly similar across the two energy resources, in terms of the percentage increase in value due to the incorporation of optimally sized storage.

Can the wind industry afford a lot of storage?

Writing in the March 19 online edition of the journal Energy & Environmental Science, Dale and his Stanford colleagues found that, from an energetic perspective, the wind industry can easily afford lots of storage, enough to provide more than three days of uninterrupted power.

Do wind and solar farms produce electricity?

Wind and solar farms provide emissions-free energy, but only generate electricity when the wind blows or the sun shines. Surplus energy can be stored for later use, but today's electrical grid has little storage capacity, so

other measures are used to balance electricity supply and demand.

What are the advantages of wind over solar power?

One advantage of wind over solar power is that it has an enormous energy return on investment, Benson explained. "Within a few months, a wind turbine generates enough electricity to pay back all of the energy it took to build it," she said. "But some photovoltaics have an energy payback time of almost two years.
