DC regulated power supply and inverter

Overview

A step down transformer will step down the voltage from the ac mains to the required voltage level. The turn's ratio of the transformer is so adjusted such as to obtain the required voltage value. The output of the transformer given as an input to the rectifier circuit.

Rectifier is an electronic circuit consisting of diodeswhich carries out the rectification process. Rectification is the process of converting an alternating voltage or current into.

This is the last block in a regulated DC power supply. The output voltage or current will change or fluctuate when there is a change in the input from ac mains or due to change in.

The rectified voltage from the rectifier is a pulsating DC voltage having very high ripple content. But this is not we want, we want a pure ripple free DC waveform. Hence a filter is.
