Does the communication base station inverter require equipment testing

Overview

What is inverter testing & evaluation?

The results of inverter testing and evaluation are used to verify that the inverter meets the necessary safety and performance requirements, and to identify any potential issues or areas for improvement. This information can be used to improve the design of the inverter, optimize its performance, and enhance its reliability and safety.

How are base stations verified?

Traditionally base stations have been verified by measuring their performance conductively at the antenna interface. With 5G, we enter a new and exciting era for base station design.

How can NEC and Fujitsu improve interoperability?

Results of the joint efforts NEC and Fujitsu have jointly developed a technology to automate the testing of interoperability between base station equipment from various vendors at the O-RAN fronthaul *4. They have enhanced the functionality to support the actual connection conditions used by operators in different countries and regions.

What are the different types of LTE-Advanced ENB transmitter tests?

LTE-Advanced eNB transmitter tests are classified into three categories: power, signal quality, and out-of-channel measurements. Power measurements include channel power and occupied bandwidth.

How do you measure a base station conductively?

These base stations can be measured conductively by connecting a cable to the base station antenna interface port. BS Type 1-H also operates in the sub-7.125 GHz range but the antenna interface consists of multiple antenna connectors connected to an antenna array.

How are 4G base stations classified?

The 4G base stations with/without an Advanced Antenna System are classified in a similar manner and many of the measurements are carried over from 4G to 5G. BS Type 1-C operates in frequencies below 7.125 GHz and has a traditional antenna interface.
