Dushanbe Power Generation Energy Storage Frequency Regulation Project

Overview

Do energy storage stations improve frequency stability?

With the rapid expansion of new energy, there is an urgent need to enhance the frequency stability of the power system. The energy storage (ES) stations make it possible effectively. However, the frequency regulation (FR) demand distribution ignores the influence caused by various resources with different characteristics in traditional strategies.

What is the comprehensive efficiency evaluation system of energy storage?

The comprehensive efficiency evaluation system of energy storage by evaluating and weighing methods is established. The multi-level power distribution strategy based on comprehensive efficiencies of energy storage is proposed. With the rapid expansion of new energy, there is an urgent need to enhance the frequency stability of the power system.

Is energy storage a new regulatory resource?

As a new type of flexible regulatory resource with a bidirectional regulation function [3, 4], energy storage (ES) has attracted more attention in participation in automatic generation control (AGC). It also has become essential to the future frequency regulation auxiliary service market.

How Fr Power is distributed to each es unit?

After receiving the FR power distributed by the power grid, the ES station redistributes it to each ES unit based on comprehensive efficiencies (Strategy I) or capacities of the ES unit (Strategy II). Table 3 represents the evaluation indicators of each ES unit in a two-hour dispatch period with different strategies.

What is the framework of frequency regulation power optimization?

The framework of frequency regulation power optimization comprises a power rolling distribution module and an efficiency evaluation module, as shown in

Fig. 1. Fig. 1. FR power optimization framework. The power rolling distribution module runs per AGC command period, including the following two steps.

How does the proposed power distribution strategy change the power distribution ratios?

The proposed strategy I changes the power distribution ratios dynamically to take full advantage of each regulatory resource. For example, when the AGC commands surge at the 64th or 102nd minute, only the ES station with better response performance outputs power to meet the FR demands as soon as possible.
