Energy Storage and New Energy Revenue

Overview

How does energy storage generate revenue?

Energy storage generates revenue in America's organized power markets through three main ways: platforms, products, and pay-days. However, different projects may tap these potential revenue streams in different ways, and investors should seek nimble developers who can navigate a complex and evolving regulatory and market landscape.

Do investors underestimate the value of energy storage?

While energy storage is already being deployed to support grids across major power markets, new McKinsey analysis suggests investors often underestimate the value of energy storage in their business cases.

How do I evaluate potential revenue streams from energy storage assets?

Evaluating potential revenue streams from flexible assets, such as energy storage systems, is not simple. Investors need to consider the various value pools available to a storage asset, including wholesale, grid services, and capacity markets, as well as the inherent volatility of the prices of each (see sidebar, "Glossary").

Are energy storage returns undervalued?

Such complexity means the expected economic returns are often undervalued, especially if shortcuts are taken to simplify the analysis. Adopting a holistic approach that considers all revenue streams across a broad range of external events could improve the outlook of energy storage returns.

Do storage additions affect renewables?

While the complementary relationship between storage and renewables is well-known, the effect of storage additions is not necessarily limited to renewables. This work models the system effects of new storage on the generation,

operating income, and retirement of power plants at three levels of increasing complexity.

How important are ancillary services to energy storage?

Ancillary services that stabilize the power grid typically represent 50 to 80 percent of the full storage revenue stack of energy storage assets deployed today. This is observed across multiple mature storage markets but is expected to decrease to less than 40 percent by 2030.
