Overview

How wireless enables modernization of the power substation?

Wireless is therefore a viable, multipurpose solution to extension of the power grid. The inherent security built into LTE/5G infrastructure and devices creates enhanced reliability and cybersecurity. In this blog, we will explore how wireless enables modernization of the power substation itself.

Is wireless a viable solution to extending the power grid?

Using wireless, however, in collaboration with the fiber backbone and its extensions brings flexibility in use cases. Wireless is therefore a viable, multipurpose solution to extension of the power grid. The inherent security built into LTE/5G infrastructure and devices creates enhanced reliability and cybersecurity.

How does indoor wireless LTE converge a power grid and substation?

The deployment of indoor wireless LTE coverage within the substation allows for controlled integration of employee communication within the control room with the LTE wireless network enabling the power grid. Figure 3: LTE converges connectivity for power grid and substation.

Why is wireless connectivity important to modernizing the grid?

Wireless connectivity is essential to modernizing the grid. Wireless technology opens up new opportunities for expanded control, scale and reliability in interconnecting power generation and distribution.

What wireless technologies are available within a substation?

There are multiple choices to wireless technologies within the substation. In your home alarm system, for instance, the subscriber identity module (SIM) in your alarm module maintains a critical wireless connection to the alarm center.

Why do we need a wireless grid management system?

When the sensors and substation IEDs, remote terminal units (RTUs) and relay systems migrate towards wireless, we will see integration of grid management and corporate communication into the same mobile devices. This decreases operational complexity at utilities, bringing the IT and OT worlds closer together.
