Overview

Can a lithium-ion battery energy storage system detect a fire?

Since December 2019, Siemens has been offering a VdS-certified fire detection concept for stationary lithium-ion battery energy storage systems.* Through Siemens research with multiple lithium-ion battery manufacturers, the FDA unit has proven to detect a pending battery fire event up to 5 times faster than competitive detection technologies.

Are battery energy storage systems causing a fire?

A look at the data and literature around Failures and Fires in BESS Systems. The number of fires in Battery Energy Storage Systems (BESS) is decreasing.

Can a battery fire alarm system detect a pending battery fire?

Through Siemens research with multiple lithium-ion battery manufacturers, the FDA unit has proven to detect a pending battery fire event up to 5 times faster than competitive detection technologies. This translates into earlier transmission of danger signals to the resident battery management and fire alarm systems.

Are lead-acid batteries safe?

Despite their long history of use, these batteries are not without safety concerns. A significant hazard associated with fire and explosion risk arises from the production of oxygen and hydrogen gases during electrolysis in the charging process. When a lead-acid battery cell is charged improperly, hydrogen production can increase dramatically.

What is the fda241 fire protection system?

The FDA241 is the ideal solution for early detection of electrical fires. In addition to controlling the automated extinguishing system, the fire protection system triggers all other necessary battery management system control functions.

Is a battery fire a hazard?

Battery fire is a credible event; these hazards (fire hazard and stored energy) should be assessed as part of the safety case for the facility. Operators should prepare a mitigating emergency response procedure for responding to a battery thermal runaway event or battery room fire.
