High frequency reactor for inverter

Overview

What is a high frequency reactor?

The high frequency reactor is the part responsible for the function of voltage/current regulation in the circuit, which it performs by cyclically charging/discharging electric energy in the circuit accompanying switching operation.

What is a network-side filtering reactor?

They are used to filter the high-frequency ripple caused by the inverter's PWM, smoothing the voltage wave at its output. We manufacture a wide range of network-side filtering reactors designed to filter the high-frequency ripple caused by the inverter's PWM, smoothing the voltage wave at its output. What benefits do our reactors offer?

.

Are high silicon electrical steel sheets suitable for high frequency reactors?

This paper examines the magnetic properties of JFE Steel's high silicon electrical steel sheets (Super Core series) as outstanding materials for high frequency reactors, which are important components for realizing energy saving in power equipment, and describes reactor performance when these materials were used in the reac-tor cores. 2.

How LC filter is used in a high frequency inverter?

For example, in order to cut higher order harmonic components, including the switching frequency, in the inverter output stage, an LC filter is normally installed. In this circuit configuration, the L component (induc-tance component) is carried by the high frequency reactor.

What is a dv/dt reactor?

Also called dv/dt reactors, these reactors are used in series between the AC

inverter output terminals and the motor. Since the inverter voltage is comprised of impulses at high switching frequency, the insulation of the motor can become stressed.

What is the main function of the output reactor?

The main function of the output reactor is to compensate for the influence of long-line (50-200m) distributed capacitance, suppress output harmonic currents, increase output high-frequency impedance, effectively suppress DV/DT and reduce high-frequency leakage current, thereby protecting the inverter and reducing The effect of equipment noise.
