How does the nb terminal communicate with the base station when it moves quickly

Overview

What is a Nb base station?

The base station is a central device that is responsible for communicating with multiple NB Nodes and collecting data from them. The base station typically consists of an NB-IoT module, a microcontroller, and a backhaul interface.

What is a NB node?

The NB Node is an IoT device equipped with NB-IoT connectivity and sensors, responsible for collecting and processing data. The base station acts as a central hub, receiving data from multiple NB Nodes, processing and forwarding it to the server or cloud platform.

What are the components of a base station?

The base station typically consists of an NB-IoT module, a microcontroller, and a backhaul interface. The NB-IoT module is responsible for providing connectivity to the NB Nodes and transmitting the data collected from them.

What is NB-IoT terminal & eNodeB?

1) NB-IoT terminal: connect to the base station through the air interface. 2) eNodeB: Mainly responsible for air interface access processing, cell management and other related functions, and connect to the IoT core network through the S1-lite interface, and forward non-access layer data to higher-level network elements for processing.

How does a UE communicate with a base station?

It begins by transmitting a series of so-called random access preambles with increasing transmission power until the base station addresses a message called random access response to the UE. Then the UE sends more information about itself in what is known as "Message 3.".

How does a cellular network communicate with the NB-IoT platform?

The cellular network links the cell tower with an IoT platform. This IoT platform stores uplink datagrams from the NB-IoT module. The customer server communicates with the IoT platform to retrieve uplink datagrams and to send downlink datagrams to the NB-IoT.
