How to do charging and discharging experiment in battery cabinet

Overview

How does a discharging circuit work?

The discharging circuit provides the same kind of changing capacitor voltage, except this time the voltage jumps to full battery voltage when the switch closes and slowly falls when the switch is opened. Experiment once again with different combinations of resistors and capacitors, making sure as always that the capacitor's polarity is correct.

How do I set up a cyclic charge discharge experiment?

Go into the Framework software and navigate to "Experiment""Electrochemical Energy"- "Cyclic Charge Discharge". Page one of the
experimental setup screen will open. See figure 2. Name your experiment
identifier under base file name. Capacity in A-hr. If known, it can be entered
here. An approximate value is suitable.

What is a charge & discharge mode?

The options for either charge or discharge mode is constant current, constant load, constant power, and capacitance times N or divided by N (also known as "C" rate). Each of the modes will decide how to you will apply the a constant to the cell to see how it will handle the constant designed by your experiment.

How do I show a cyclic charge discharge in Echem analyst?

The Show Curve Selector button is selected in the top left of time. To do this, the first step will be to open the Echem Analyst software. From there you will want to click the Open icon. This will take you to C:\Users\Public\Documents\My Gamry Data. Then click on your cyclic charge discharge folder.

How do I access cyclic charge discharge files?

To do this, the first step will be to open the Echem Analyst software. From

there you will want to click the Open icon. This will take you to C:\Users\Public\Documents\My Gamry Data. Then click on your cyclic charge discharge folder. Select the subfolder and select all the Charge and Discharge files. Press Open.

Do I need a large-value capacitor to do this experiment?

To do this experiment, you will need the following: Large-value capacitors are required for this experiment to produce time constants slow enough to track with a voltmeter and stopwatch. Be warned that most large capacitors are of the "electrolytic" type, and they are polarity sensitive!
