# Inverter voltage disturbance at a certain frequency

#### **Overview**

Are inverters a threat to power systems?

Findings in various regions suggest that a significant proportion of resources based on inverters can lead to several issues, including voltage and frequency instability, thereby threatening the security of the power system [7, 10], which can be exacerbated when associated with small and weakly interconnected grids .

What frequency should a PV inverter be tripped?

In the NEM, the FOS requires power system frequency to remain in the range 49.5 Hz – 50.5 Hz for a single contingency event. The data above indicates there would be no tripping of the PV inverters in response to the frequency disturbance in this instance.

Do inverter-dominated grids affect frequency stability?

The frequency response is assessed following largest power infeed loss by plants technology (IBR or synchronous generator). The results demonstrate that inverter-dominated grid mainly impact frequency stability rather than voltage stability, with the disconnection of weaker PV plants during faults leading to underfrequency load shedding.

Does switching frequency affect the stability of an inverter?

However, there is no research on the influence of switching frequency on the stability of the inverter. In this paper, the detailed sequence impedance model of the current controlled inverter is firstly established, and its correctness is verified by frequency sweeping.

Do photovoltaic inverters respond to frequency disturbances?

AEMO undertook a study to investigate how small inverters that connect photovoltaic generation to the electricity network are likely to respond to frequency disturbances. This report is based on information available to AEMO

as at May 2015 although AEMO has endeavored to incorporate more recent information where practicable.

Do small-scale PV inverters respond to frequency disturbances?

Given the volume of inverter-connected small-scale PV generation in the NEM, and the lack of information on how they would respond to frequency disturbances, AEMO initiated a stocktake of the current fleet of small-scale PV inverters and their frequency trip settings.
