# Optical cable budget for communication base station energy storage room

#### **Overview**

What is optical power budget?

1. Understanding the Basic Equation of Optical Power Budget The optical power budget represents the difference between the transmitted power and the received power, which must be greater than the total losses in the system to maintain reliable communication. The fundamental equation that governs the optical power budget calculation is as follows:.

What is a good power margin for a fiber optic system?

A power margin of around 3-6 dB is recommended for most fiber optic applications, providing an adequate cushion for unexpected losses and system contingencies. Key Words: Optical Power Budget, Optical Fiber, Communication Systems, Transmitted Power, Received Power, Fiber Attenuation, Splice Losses, Connector Losses, Power Margin.

How much energy does a telecommunication room save?

Typical conventional telecommunication room power modernization (load 270 kW, efficiency improved from 88% to 98%) can save 250 000 kWh/year. In addition, low efficiency of the power system causes high heat consumption. As a result, the cooling capacity and configuration of air conditioners in the telecommunication room are high.

How many power systems does a telecommunication room use?

The new- generation telecommunication room energy solution uses only one power system to provide power supply, backup and distribution for CT and IT devices. No independent AC power system or AC cable tray is required. Figure 3 shows the recommended power supply architecture of the access telecommunication room.

How do you calculate optical power budget?

Optical Power Budget (dB) = Transmitted Power (dBm) - Received Power

(dBm) In this equation, Transmitted Power (dBm) refers to the power of the input light signal propagated through the optical fiber, while Received Power (dBm) indicates the power of the output light signal at the receiving end.

Can telecommunication room power supply system support solar access?

Third, conventional telecommunication room power supply system cannot support solar access. It cannot optimize the power supply structure and reduce the energy consumption cost by using solar energy, which cannot help operators effectively fulfil social responsibilities of energy saving and emission reduction.
