# Photovoltaic energy storage cabinets to reduce peak loads and fill valleys

#### **Overview**

The configuration of user-side energy storage can effectively alleviate the timing mismatch between distributed photovoltaic output and load power demand, and use the industrial user electricity price mechanis.

Why is energy storage important in a photovoltaic system?

When the electricity price is relatively high and the photovoltaic output does not meet the user's load requirements, the energy storage releases the stored electricity to reduce the user's electricity purchase costs.

What is the optimal capacity allocation model for photovoltaic and energy storage?

Secondly, to minimize the investment and annual operational and maintenance costs of the photovoltaic-energy storage system, an optimal capacity allocation model for photovoltaic and storage is established, which serves as the foundation for the two-layer operation optimization model.

How to increase the economic benefits of photovoltaic?

When the benefits of photovoltaic is better than the costs, the economic benefits can be raised by increasing the installed capacity of photovoltaic. When the price difference of time-of-use electricity increases, economic benefits can be raised by increasing the capacity of energy storage configuration.

Why do we need a capacity allocation model for PV-storage systems?

This is done in response to peak and valley tariffs and step tariff policies. The main contributions are as follows: A capacity allocation model is proposed for the general design of the PV-storage system, which addresses the issue of optimal capacity allocation for such systems.

Why is distributed photovoltaic technology important?

The deployment of distributed photovoltaic technology is of paramount importance for developing a novel power system architecture wherein

renewable energy constitutes the primary energy source.

What is user-side energy storage?

The configuration of user-side energy storage can effectively alleviate the timing mismatch between distributed photovoltaic output and load power demand, and use the industrial user electricity price mechanism to earn revenue from peak shaving and valley filling.
