#### **Overview**

This application blog article by Benno Kirschenhofer, Panasonic Industry Europe discusses passive components selection guide for solar inverters including capacitors, resistors and inductors. What is a solar inverter?

A solar inverter (also called a photovoltaic or PV inverter) converts direct current (DC) into alternating current (AC) and is widely used in solar photovoltaic power generation systems. Solar inverters available today are generally divided into three types: central inverters, string inverters and microinverters.

Can Panasonic passive components improve the design of string inverters?

In this blog article, we would like to introduce Panasonic's passive components and show how they can contribute to optimizing the design of string inverters. Regardless of the type of solar inverter, the key requirements are high efficiency, high reliability and input voltage with a wide range of capacitance values. Figure 1.

What are the different types of solar inverters?

Solar inverters available today are generally divided into three types: central inverters, string inverters and micro-inverters. Central inverters are mainly used in large-scale ground power stations, suitable for high-voltage grid connections. The power range is normally between 100kW and 2500kW.

Can Panasonic film capacitors optimize solar inverter design?

We are committed to high output, high safety and high reliability, so Panasonic's film capacitors can help optimize your solar inverter design. Panasonic OS-CON conductive polymer solid aluminium capacitors play a major role in the optimization of solar inverters.

What makes a good solar inverter resistor?

For the resistor, this means high reliability with long lifetime, high voltage-

withstand capability and high accuracy. Panasonic has a variety of resistor families that can be employed in solar inverters applications.

What is a string inverter?

String inverters, also known as distributed inverters, are mainly used in industrial, commercial and residential areas. Power stations that use string inverters are not generally very large, and they are integrated into the national supply through full or surplus power grid connection. The power range is normally up to 200kW.
