# Photovoltaic panels and batteries can be connected in series

#### **Overview**

We know that solar panels and batteries can be wired either in series, parallel or combination of series-parallel connection depending on the system voltage, backup capacity, load rating etc. Why do solar panels need to be connected in series?

Putting panels in series makes it so the voltage of the array increases. This is important because a solar power system needs to operate at a certain voltage for the inverter to work properly. So, you connect your solar panels in series to meet the operating voltage window requirements of your inverter.

What if two solar panels are connected in series?

So, if you connect two solar panels with a rated voltage of 40 volts and a rated amperage of 5 amps in series, the voltage of the series would be 80 volts, while the amperage would remain at 5 amps. Putting panels in series makes it so the voltage of the array increases.

What happens if a solar panel is wired in series?

Circuits wired in series work the same way for solar panels. If there is a problem with the connection of one panel in a series, the entire circuit fails. Meanwhile, one defective panel or loose wire in a parallel circuit will not impact the production of the rest of the solar panels.

Should solar panels be wired in parallel?

Wiring in parallel allows you to have more solar panels that produce energy without exceeding the operating voltage limits of your inverter. Inverters also have amperage limitations, which you can meet by wiring your solar panels in parallel. How do solar panels wired in series compare to solar panels wired in parallel?

How PV panels are connected in series configuration?

The following figure shows PV panels connected in series configuration. With this series connection, not only the voltage but also the power generated by the module also increases. To achieve this the negative terminal of one module is connected to the positive terminal of the other module.

How to connect solar panels in parallel configuration?

The parallel combination is achieved by connecting the positive terminal of one module to the positive terminal of the next module and negative terminal to the negative terminal of the next module as shown in the following figure. The following figure shows solar panels connected in parallel configuration.
