Single-phase inverter with closed loop

Overview

TL;DR: In this article, a closed-loop PI controller with unipolar pulse width modulation (PWM) and an LC output filter is employed to simplify the system, reduce THD in the output voltage and current, ensure stability, and decrease mechanical vibrations. Can CLO-SED-loop control a single-phase off-grid inverter?

E-mail: zhangyzz@yeah.net This paper proposes a control strategy for single-phase off-grid inverter, which integrates the three clo-sed-loop control with the iterative-based RMS algorithm. The inverter circuit is modeled, and simulation experiment and prototype verification are performed on Matlab.

What is a closed-loop control inverter?

Closed-loop control inverters are gaining ever-wider application in various power scenarios such as medical, industrial and military. The requirements for the steady-state and dynamic performances of their output voltage waveforms are becoming increasingly demanding under various load conditions.

What is a single-phase inverter?

A single-phase inverter is a power supply device that converts direct current into single-phase alternating current. Since the feedback information of the inver.

How can a single-phase inverter improve performance?

By establishing the mathematical model of the single-phase inverter, the current inner loop control can obtain rapid dynamic performance, and the voltage outer loop control can improve the steady-state performance of the system. Secondly, using the pole configuration method, the parameters of the double closed-loop PI can be obtained.

Can Dual-loop control improve steady-state performance of single-phase inverter power supply?

Secondly, using the pole configuration method, the parameters of the double closed-loop PI can be obtained. Finally, the model is built by SIMULINK. The simulation results verify that the dual-loop control can improve and improve the steady-state performance and dynamic performance of single-phase inverter power supply.

What is a phase locked loop?

A phase locked loop is a closed loop system in which an internal oscillator is controlled to keep the time and phase of an external periodical signal using a feedback loop. The PLL is simply a servo system that controls the phase of its output signal such that the phase error between the output phase and the reference phase is minimum.
