Standard value of protection voltage for communication base stations

Overview

Where should surge protective devices be installed in a power meter station?

Surge protective devices (SPDs) shall be installed at the RBS side of the power meter station (i.e., downstream of the circuit breakers). These SPDs shall comply with [IEC 61643-11] and withstand the current: is the number of metallic services entering the RBS m is the number of conductors of the power line.

What is a preferred power supply architecture for DSL applications?

A preferred power supply architecture for DSL applications is illustrated in Fig. 2. A push-pull converter is used to convert the 48V input voltage to +/-12V and to provide electrical isolation. Synchronous buck converters powered off of the +12V rail generate various low-voltage outputs.

What is a 3G base station converter?

In a 3G Base Station application, two converters are used to provide the +27V distribution bus voltage during normal conditions and power outages.

Is there a standard for a base station antenna?

The BSA's influence on coverage, capacity, and QoS is extensive, and yet there exists no comprehensive, global, standard focusing on the base station antenna. The purpose of this whitepaper is to address this gap. In particular, the following topics will be covered in various degrees of detail:.

What is the operating environment of a base station antenna?

The operating environment of base station antennas is classified as remote, stationary, outdoor, uncontrolled and not weather-protected. The electromagnetic environment includes close proximity to intentionally radiating devices and installation on structures prone to lightning strikes.

What voltage does a DSL power system supply?

The DSL power system may supply both higher voltage analog line drivers and amplifiers (typ. \pm 12V) and several low voltage supplies required by the digital ASIC (\pm 5V, \pm 3.3V, \pm 1.8V, \pm 1.5V).
