#### **Overview**

What makes a lithium battery different?

Of course, each lithium battery type has unique characteristics that set it apart and make it more suitable for certain applications. The comparison usually consists of energy density, safety, cycle life, cost, and the main application that is more suitable for that lithium battery type. Below is a comparison table of lithium battery types.

What are the different types of lithium batteries?

Here are some of the main types of lithium batteries that are commonly used in everyday life. Lithium ion (Li-ion) batteries are one of the most common types of batteries used in everyday electronic devices such as smartphones, laptops, and electric vehicles (EVs). This type of battery has a high energy density despite its small size.

What is a lithium battery?

Lithium battery is basically one type of battery that uses lithium technology as the main component in their electrochemical cell. Lithium batteries are widely used because of their high battery energy density reliability, lightweight design, and long battery life cycle compared to other traditional battery technologies.

How do lithium batteries store energy?

Lithium batteries rely on lithium ions to store energy by creating an electrical potential difference between the negative and positive poles of the battery. An insulating layer called a "separator" divides the two sides of the battery and blocks the electrons while still allowing the lithium ions to pass through.

Do all batteries use lithium?

No, not all batteries use lithium. Lithium batteries are relatively new and are becoming increasingly popular in replacing existing battery technologies. One

of the long-time standards in batteries, especially in motor vehicles, is leadacid deep-cycle batteries.

Are polymer batteries better than lithium ion batteries?

Polymer cells and traditional lithium-ion batteries are different in how they're made. Lithium batteries are soft and rolled, while polymer batteries have a stiffer shape. Polymer batteries are safer and last a long time (over 500 times), but they cost more, about 100% more than 18650 lithium-ion cells with the same capacity.
