TI494c inverter undervoltage protection

Overview

What is tl494 power supply control circuit?

The TL494 is a fixed frequency, pulse width modulation control circuit designed primarily for SWITCHMODE power supply control. 1. Complete Pulse Width Modulation Control Circuitry 2. On-Chip Oscillator with Master or Slave Operation 3. On-Chip Error Amplifiers 4. On-Chip 5.0 V Reference 5. Adjustable Deadtime Control 6.

What does tl494 mean?

The TL494 is a fixed frequency, pulse width modulation control circuit designed primarily for switch mode power supply control. MAXIMUM RATINGS (Full operating ambient temperature range applies, unless otherwise noted.) Stresses exceeding those listed in the Maximum Ratings table may damage the device.

What is a tl494 overvoltage protection circuit?

Overvoltage-Protection Circuit The following design example uses the TL494 to create a 5-V/10-A power supply. This design is based on the following parameters: The 32-V dc power source for this supply uses a 120-V input, 24-V output transformer rated at 75 VA.

What are the components of tl494?

The TL494 device contains two error amplifiers, an on-chip adjustable oscillator, a dead-time control (DTC) comparator, a pulse-steering control flip-flop, a 5-V, 5%-precision regulator, and output-control circuits. The error amplifiers exhibit a common-mode voltage range from -0.3 V to VCC - 2 V.

What voltage is tl494?

Reference Voltage vs Input Voltage The TL494 is designed to operate from an input voltage supply range between 7 V and 40 V. This input supply should be well regulated. If the input supply is located more than a few inches from the

device, additional bulk capacitance may be required in addition to the ceramic bypass capacitors.

Does the tl494 use a noninverting amplifier?

The design of the TL494 employs both amplifiers in a noninverting configuration. Figure 23 shows the proper bias circuits for negative and positive output voltages. The gain control circuits, shown in Figure 11, can be integrated into the bias circuits. Figure 23. Error-Amplifier-Bias Configurations
