# UPS uninterruptible power supply equipment installation includes battery cabinet installation

## Overview

---

Why should you install an uninterruptible power supply (UPS)?

Proper installation and setup of an Uninterruptible Power Supply (UPS) are crucial to ensure reliable power protection for your equipment. Whether you are installing a UPS for a home office, business network, or industrial site, following best practices helps prevent failures and optimises performance. In this section, we'll cover:

Are there user-serviceable parts inside the ups?

There are no user-serviceable parts inside the UPS. The UPS operates with mains, battery or bypass power. It contains components that carry high currents and voltage. A properly installed enclosure is earthed and IP20 rated against electrical shock and foreign objects.

How do I install an UPS system?

Use the following basic sequence of steps to install the UPS: 1. Create an installation plan for the UPS system. 2. Prepare your site for the UPS system. 3. Inspect and unpack the UPS cabinet. 4. Unload and install the UPS cabinet and wire the system. 5. Complete the installation checklist provided in Section 4.2.

What should I know before installing the ups?

**CAUTION** Before you operate the UPS, make sure that all the installation tasks are completed and a preliminary startup has been performed by authorized service personnel. The preliminary startup verifies all the electrical interconnections to make sure that the installation was successful and the system operates properly.

Does the 91ps/93ps ups C-model have internal batteries?

Note: The 91PS/93PS UPS C-model does not have internal batteries. In the C-model, the internal battery breaker CB1 is used for disconnecting external

batteries from the UPS power module. See Section 5.3 for instructions on how to install an external battery cabinet.

Can I use my ups outside?

The system is not intended for outdoor use. Before you start any installation or service work, make sure that all AC and DC power sources are disconnected. Power may come from multiple sources. Also ensure system grounding / PE continuity. In a parallel system, the output terminals may be energized even when the UPS is turned off.
