# What is the Integrated Energy Storage Project

#### **Overview**

What is a generation-integrated energy storage system?

Generation-integrated energy storage (GIES) systems store energy before electricity is generated. Load-integrated energy storage (LIES) systems store energy (or some energy-based service) after electricity has been consumed (e.g., power-to-gas, with hydrogen stored prior to consumption for transport or another end-use).

What is a load-integrated energy storage system?

Load-integrated energy storage (LIES) systems store energy (or some energy-based service) after electricity has been consumed (e.g., power-to-gas, with hydrogen stored prior to consumption for transport or another end-use). GIES systems have received little attention to date but could have a very important role in the future .

What are energy storage systems?

Energy storage systems allow energy consumption to be separated in time from the production of energy, whether it be electrical or thermal energy. The storing of electricity typically occurs in chemical (e.g., lead acid batteries or lithium-ion batteries, to name just two of the best known) or mechanical means (e.g., pumped hydro storage).

What is a hybrid energy storage system?

When the hybrid generation system or energy storage system boasts of adequate regulation capacity and can quickly regulate active power, the dispatch end can regulate system frequency to ensure the control error is within specified range and stabilize the system frequency. The hybrid new generation integrated energy storage system boasts of AGC.

What is integrated energy system?

Integrated energy systems, sector integration, sector coupling - it goes by

many names but is, in essence, the same principle; creating a smart energy system that links energy-consuming sectors to the power grid to optimize the synergy between production of energy and use of energy. The smart move towards a carbon-free economy.

Can integrated energy storage be integrated?

An increasingly critical challenge for the utilities would be to maximize the integration of integrated energy storage in the near future. The key goal is to build an integration plan for integration of the distributed storage systems on a general and incredibly scalable basis using common platforms for software and hardware.
