# Wind power interference at mobile energy storage sites

#### **Overview**

How a wind farm can improve frequency regulation?

The energy storage system can increase and decrease the output flexibly, which can improve the frequency regulation characteristics of the power system with wind power. Therefore, wind farms can build energy storage power stations with a certain capacity and undertake the task of frequency regulation.

Can energy storage and wind turbines contribute to power system frequency regulation?

In view of the frequency problem caused by the large-scale grid connection of wind power, this chapter proposes to use energy storage and wind turbines to cooperate with traditional thermal power plants to participate in power system frequency regulation , , .

Can energy storage control wind power & energy storage?

As of recently, there is not much research done on how to configure energy storage capacity and control wind power and energy storage to help with frequency regulation. Energy storage, like wind turbines, has the potential to regulate system frequency via extra differential droop control.

Can energy storage systems reduce wind power ramp occurrences and frequency deviation?

Rapid response times enable ESS systems to quickly inject huge amounts of power into the network, serving as a kind of virtual inertia [74, 75]. The paper presents a control technique, supported by simulation findings, for energy storage systems to reduce wind power ramp occurrences and frequency deviation.

Should a wind farm be integrated with a battery energy storage system?

Integrating a wind farm with a battery energy storage system (BESS) could

improve the intermittence and randomness of the output power of the wind farm, and hence reduce the negative impacts on the security and economics of the power system concerned.

Can wind turbines and energy storage devices avoid secondary frequency drops?

This study proposes a coordinated control technique for wind turbines and energy storage devices during frequency regulation to avoid secondary frequency drops, as demonstrated by Power Factory simulations.
